NORRIS DAM HOLDS BACK THE FLOODS

This solid concrete structure, towering 265 feet above the bed of the Clinch River in northeast Tennessee, helps control seasonal floods on the Tennessee and Mississippi Rivers, aids navigation in months of low flow, and its two 66,000 horsepower generating units utilize the falling water in the Clinch River to provide electricity for many towns, farm homes and industries in the Valley. The 35,000-acre lake, formed by completion of the dam in 1936, is now widely known as a recreation area.
